Unions :

Union is a user defined data type but unlike structures, union members share same memory location.

Eg :

```
struct abc
{
    int a;
    char b;
};
```

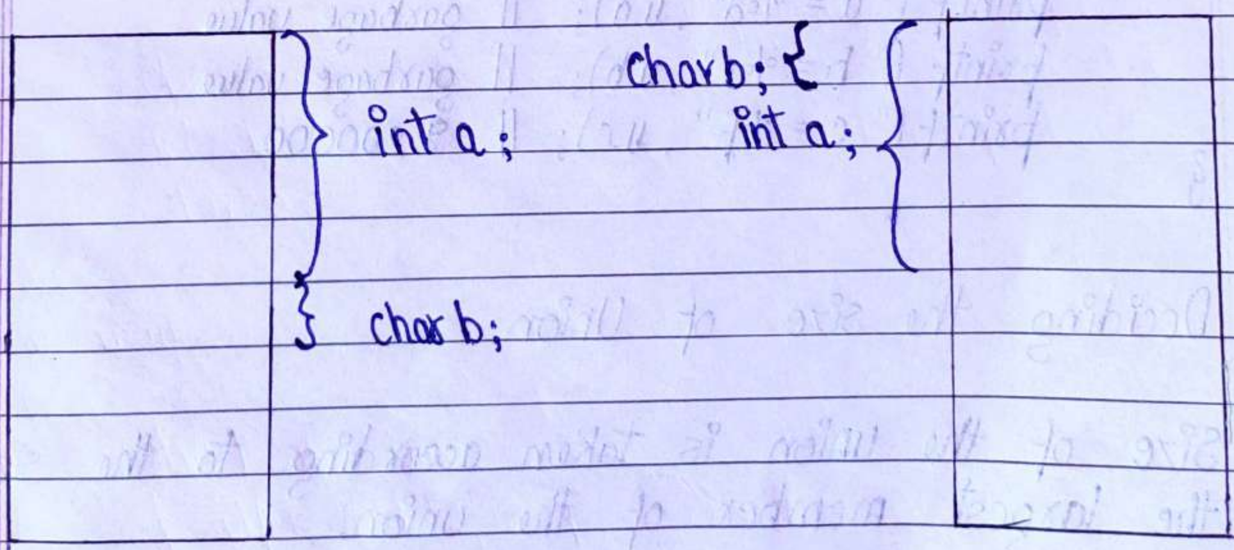
```
union abc
{
    int a;
    char b;
};
```

	struct abc	union abc
a's address =	6295624	6295616
b's address =	6295628	6295616

Memory Allocation :

Struct abc

Union abc



In union, members will share same memory location. If we make changes in one member then it will be reflected to other member as well.

```
Union abc
{
    int a;
    char b;
    float c;
};
int main ()
{
    Union abc u;
    u.a = 1;
    u.b = 97;
    u.c = 9.2;

    printf ("a = %d", u.a);  // garbage value
    printf (" b = %c", u.b); // garbage value
    printf (" c = %f", u.c); // 9.200000
}
```

~~1~~ ~~97~~ 9.2

4 bytes memory

Deciding the size of Union

Size of the union is taken according to the size of the largest member of the union.
