

Coding Practice Set - 06

1. Write a program to declare an integer variable and a pointer variable, assign the address of the integer to the pointer, and print the value of the integer using the pointer variable.
2. Write a program to swap the values of two variables using pointers via a function (Call by Reference).
3. Write a program to find the maximum number between two numbers using pointers.
4. Write a program to input and print array elements using pointer arithmetic rather than standard array indexing.
5. Write a program to calculate the sum of all elements in an integer array using a pointer.
6. Write a program to compute the length of a string using a character pointer.
7. Write a program to declare a void pointer, assign it the address of a float variable, type-cast it appropriately, and print the value.
8. Write a program to demonstrate the use of a pointer-to-pointer (double pointer) by using it to change the value of an ordinary integer variable.
9. Write a program to copy the contents of one array into another array using pointers.
10. Write a program to reverse a string in-place using two pointers (one pointing to the start and the other to the end of the string).
