

Coding Practice Set - 07

1. Write a program to define a structure named Book with members book_id (int), title (char array), and price (float). Input data for one book from the user and display it.
2. Write a program to calculate the total number of days between two dates by storing them in a Date structure containing day, month, and year.
3. Write a program to read and display the records of 5 students using an array of structures.
4. Write a program to add two distance structures (given in feet and inches) using a function that takes structure instances as arguments and returns a structure result.
5. Write a program to declare a structure, initialize its members, and access them using a structure pointer and the arrow (->) operator.
6. Write a program to demonstrate the use of typedef to create a shorter alias for a structure named Employee and use it to instantiate variables.
7. Write a program to compare two variables of a structure type named Time (with hours, minutes, and seconds members) to check if they are equal.
8. Write a program that demonstrates the size difference of a structure containing a mix of char and int fields before and after enforcing structure packing via #pragma pack(1).

- 9. Write a program to implement a function that accepts a structure pointer as a parameter to update a student's marks (Pass by Reference).**
- 10. Write a program to find the highest-scoring student from an array of 5 student structures by passing the array to a dedicated search function.**
