

this - pointer

this is a keyword

- * **this** is a local object pointer in every instance member function containing address of the caller object
- * this pointer is used to point member of object and to resolve conflicts b/w local variable and instance member variable having same name

```
#include <iostream>
```

```
using namespace std;
```

```
class member
```

```
{
```

```
private:
```

```
int l, b, h;
```

```
public:
```

```
void setDimension ( int l , int b , int h )
```

```
{
```

containing
address of caller
object

```
    this → l = l;
```

```
    this → b = b ;
```

```
    this → h = h ;
```

```
}
```

```
void showDimension ( )
```

```
{
```

```
    cout << "l = " << l << " b = " << b << " h = " << h;
```

```
}
```

```
};
```

```
int main ( )
```

```
{
```

```
    member box;
```

```
    box.setDimension ( 5, 10, 12 );
```

```
    box.showDimension ( );
```

```
}
```

```
    return 0;
```
